

## FABRIC V8.0.0 HOT FIX 1 RELEASE NOTES

These Release Notes describe the new features in Fabric release V8.0.0 HF1 and list bugs that have been fixed since the V8.0.0 release.

Certification of this Fabric release is based on:

- Cassandra version 4.1.3
- SQLite version 3.44.1
- OpenJDK Runtime Environment 21.0.1
- Confluent Kafka version 7.2.1
- Neo4j 5.12.0 – enterprise
- Elasticsearch – 8.5.3
- AWS OpenSearch – 1.3.4
- PostgreSQL 15.4

### RESOLVED ISSUES

- Downgrading of SQLite from version 3.45.2 to version 3.44.1 as it caused a performance issue in the sync process.
- MDB\_EXPORT command failed in case where a foreign key was pointing to a field with a unique index; it worked only when the field was part of the primary key.
- Common tables – the removal of redundant warning messages in case of a redeployment.
- iidFinder – LU deployment failed with NPE when having additionalParent=true in the root table.
- Broadway – fixed the plugin widget in the parameters' updates.
- Default settings in the plugins.discovery are updated as follows , on a project level as well, when needed:
  - The max size of the sample is set to 500.
  - "Metadata Logical Reference" plugin for creating new relations is set to inactive, most scores within the plugin definition were updated to be lower than the threshold.
  - "global\_schema\_exclude" section is added with the initial list of schemas to be excluded. The syntax supports regular expressions.
  - Several Catalog UI fixes and usability improvements.
- It is now possible to first add a Stage Condition actor and then to mark it as 'else' (before the fix – one had to mark a stage as 'else' and only then to add a condition).
